New innovation for managing IML labels - Now verified in production!

Rollquett AB, a Swedish start-up company, has in April completed the first installation in production with IML-labels on reel. Production in full scale without remarks is now verified at W.u.H. Fernholz GmbH & Co. KG in Meinerzhagen, Germany.

“We are very pleased with how fast and easy it was to get into full scale production with Rollquett’s IML dispenser. With Rollquett we have increased positioning accuracy of labels and the traditional challenge of separating labels is completely eliminated” says Dr.-Ing. Thorsten Kirschnick at Fernholz and he adds, “Another of several positive effects is that the labels now always is properly oriented in production line.”

“This verifies that Rollquett AB is ready to commercialize our product offerings after several years of targeted development work” says Ove Känngård, who took over as Managing Director of Rollquett AB in January 2018 and he adds, “We add an increased profitability, partly due to the fact that print houses offer lower costs for labels on reel and partly because of less workload for machine operators with Rollquett's unique and patented systems installed in IML production lines.”
